Donor selection and control

Medicaments must be brought to first appointment

In Spain, oocyte donation is regulated by law (14/2006, 26th May)

At GIREXX, donor selection is made in a very rigorous way observing every aspect of Spanish current regulations.

Prospective donors are informed about the requirements to take part in the egg donation programme and about the details of the process before being accepted as a donor.

The following tests are performed:

- Detailed medical history of donor and her family
- Complete gynaecological examination
- Phenotype
- Vaginal ultrasound scan
- Smear test
- Complete Blood Test (depending on protocol) (*)
- Genetic tests (Karyotype)

The donor-recipient matching process is rigorously done by analysing Rh compatibility and also the couple's physiognomy traits.

(*) Complete Blood Count, VSG, Prothrombin time, Cephalin time, Group and Rh, Glycemia, Urea, Creatinine, Uric acid, Cholesterol, VII coagulation factor, Triglycerides, Total bilirubin, Transaminases (SGOT/SGPT). PLAP, RPR, VDRL, Rubeola, Toxoplasmosis IgG, HBsAg, HCV Antibodies, HIV1/HIV2, FSH (3rd day of cycle), Karyotype in peripheral blood.
